

# Use of Random Forest to predict the main factors that affects ammonia volatilization in Mediterranean climate cropping systems

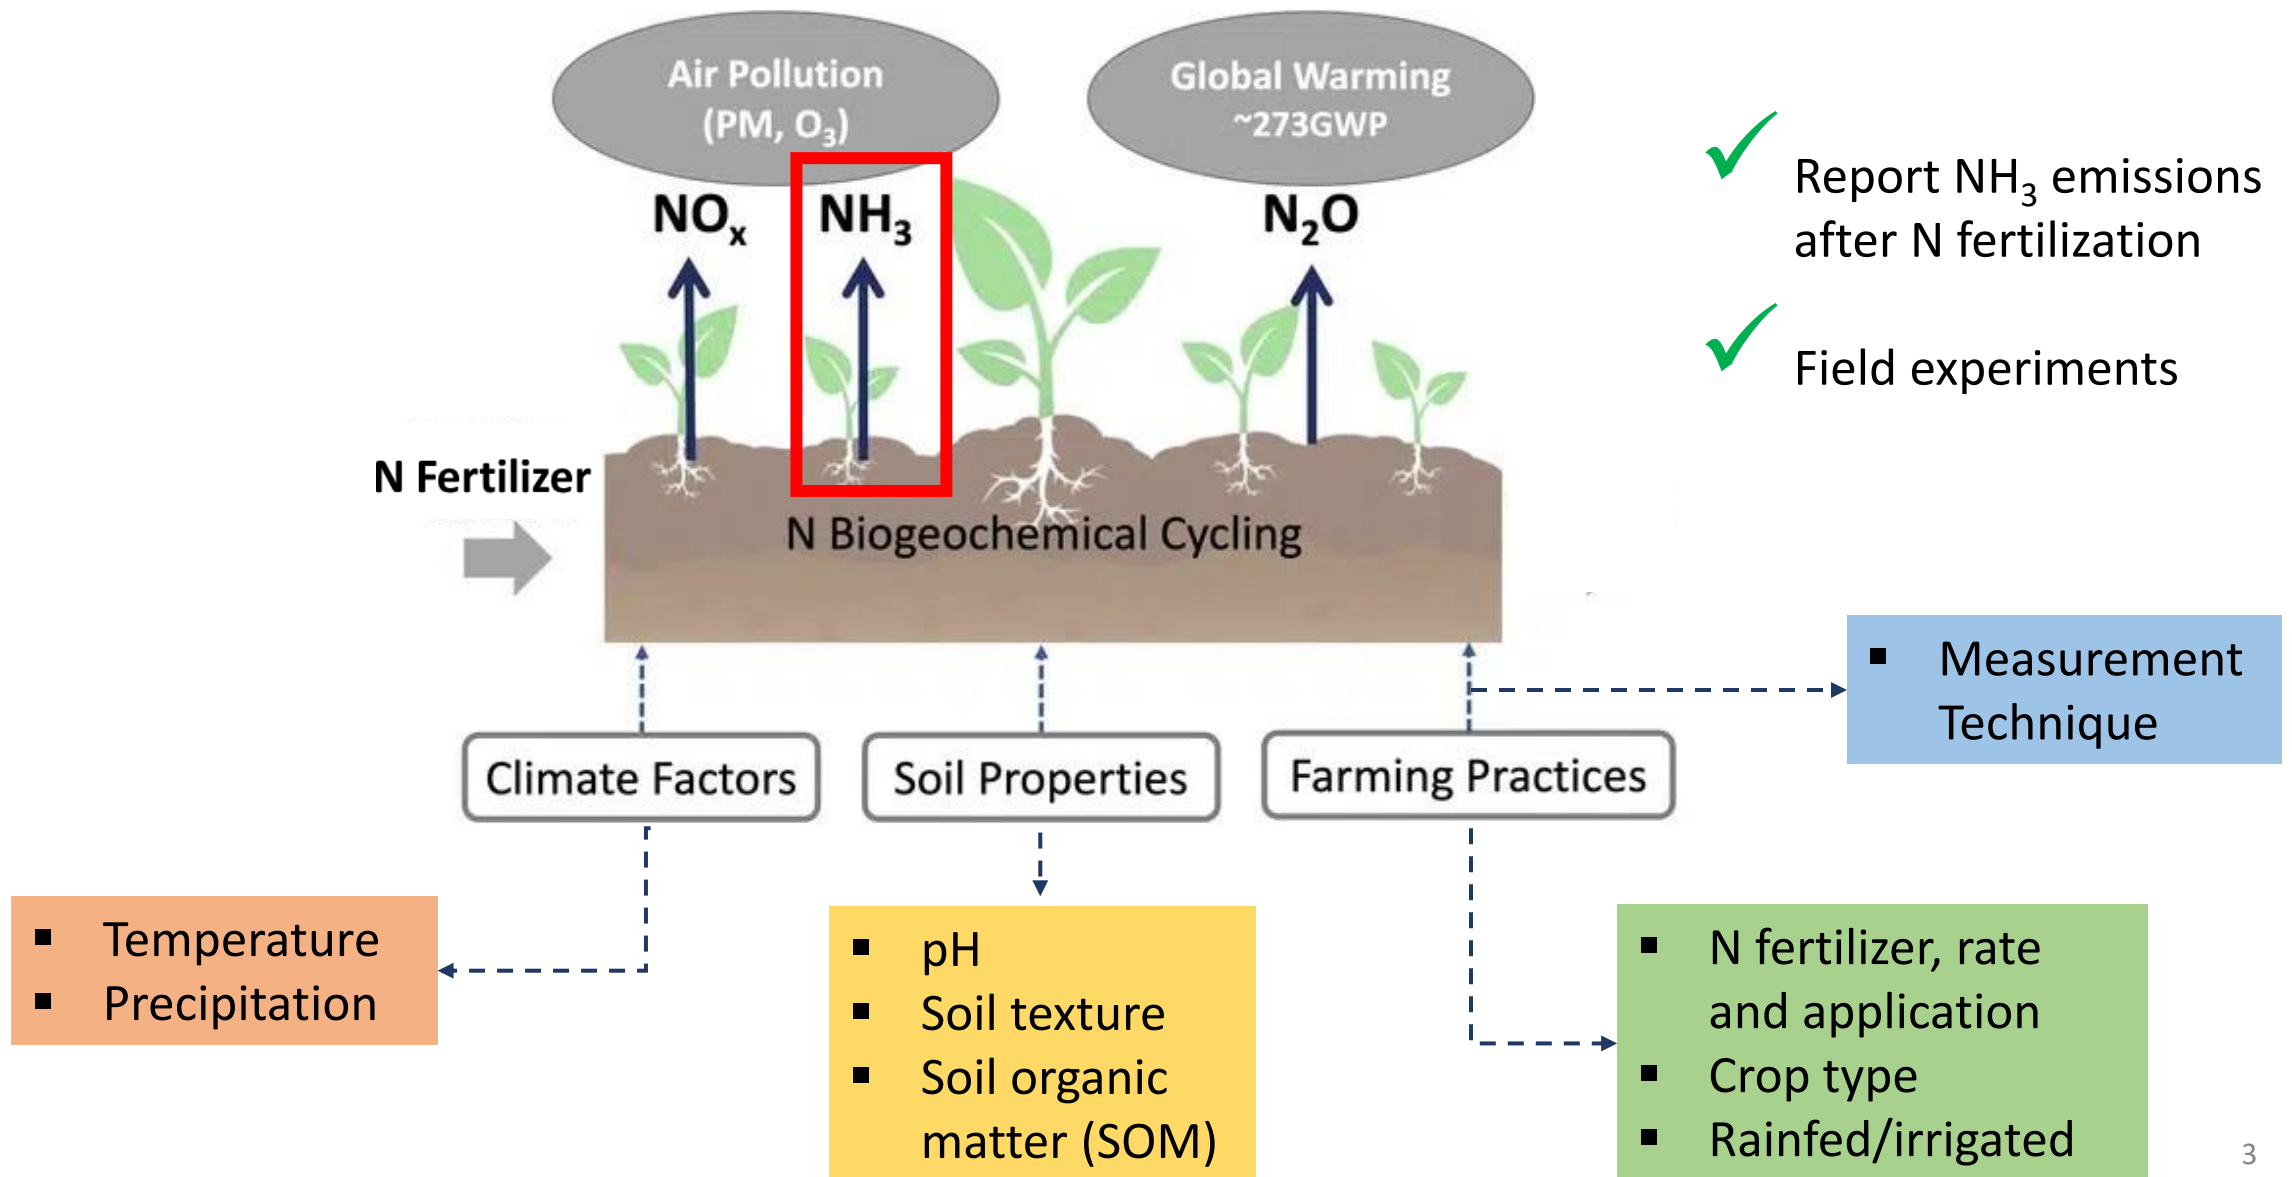

J. Hurtado Patiño, E. Velázquez, L. Lassaletta, G. Guardia, E. Aguilera, A. Sanz-Cobeña

Luo et al., 2022

# DATA COLLECTION

# DATA COLLECTION

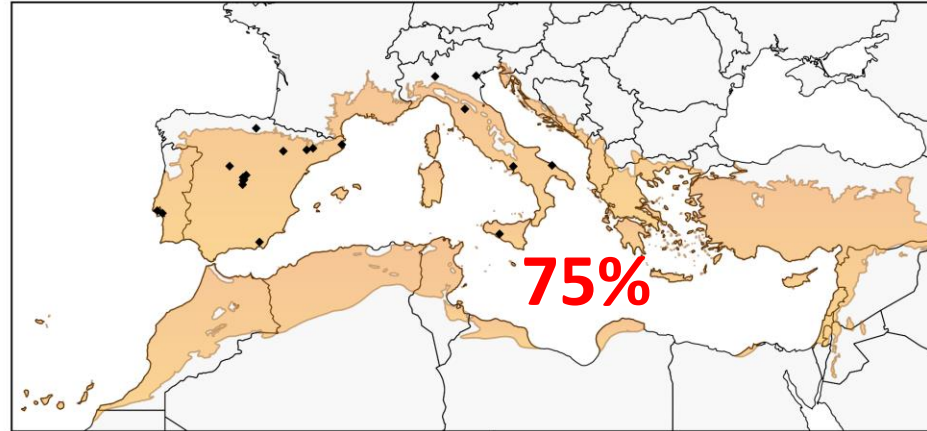

Response variables:  
1. Cumulative  $\text{NH}_3$  emissions  
(kg  $\text{NH}_3$ /ha)  
2. Emission factor  
(EF, %)

Emission  
Factor (%)

# SUMMARY AND CONCLUSIONS

- Random Forest is a suitable method to predict ammonia emissions.
- Soil pH is the most important variable that affects ammonia volatilization.
- We still cannot conclude that the intrinsic Mediterranean characteristics influence ammonia emissions.
